

Key Highlights

Food insecurity worsened further in March, just before Ramadan

- Food insecurity deteriorated in March 2024 (Figure 1) just before the start of the Ramadan festivities with inadequate food consumption reaching unprecedented highs over the last one year. Although most food insecurity outcome indicators were worse in areas under the control of the Sana’a Based Authorities (SBA) during the reporting period, inadequate food consumption was higher in Government of Yemen (GoY) areas by an estimated 6 percent.
- The deterioration in household food insecurity was driven by multiple factors — the reduction in WFP’s general food assistance in the SBA areas, the aftereffects of the Red Sea crisis, the weaker local currency in the GoY areas and to typical seasonal drivers. February-March is the post harvest season when household food stocks and income from agricultural sales are starting to decline. In addition, households reporting decrease/ loss in income was the highest in record, disproportionately more in SBA areas, which indicates an earlier than normal seasonal depletion.
- With the onset of Ramadan from the second week of March, food insecurity was expected to slow down because of increased flow of Zakat, sharing and remittances. However, due to the new financial sanctions, the likely reduced remittances are expected to suppress the gains from Ramadan festivities. Food insecurity is further expected to worsen during the post-Ramadan period, likely to peak during June – July 2024.
- Immediate and accelerated scale up of targeted emergency food and livelihood assistance is recommended in the areas/ governorates most in need.

Figure 1. Percentage of households with inadequate food consumption (FC Score poor + borderline)*

* Please be aware that the data for this round was gathered from February 27 to March 10, 2024, shortly before the Ramadan celebrations

- The prevalences of food insecurity in Al Bayda, Al Jawf, Hajjah, and Raymah governorates were considerably higher than the national average in at least four out of the five outcome indicators. Al Jawf and Hajjah have consistently been food insecure in nearly all the HFM monitoring rounds pointing to chronic issues. Moreover, the Hajjah (42%) and Al Jawf (33%) had substantial share of the population receiving humanitarian food assistance before the WFP pause in November 2023. Inadequate food consumption increased by more than 5 per cent month-on-month and above the twelve months' average in Al Dhale'e, Al Hudaydah, Hadramawt, Ibb, Lahj, and Taizz (Figure 2).

Figure 2. Percentage of households with inadequate Food Consumption by Governorates (FCS borderline + poor)

- The adoption of severe livelihood and/or food consumption coping strategies also increased in March 2024 compared to February 2024 (Figure 3 and 4). Households often resorting to severe food-based coping strategies was 2 percent and 1 percent higher in SBA and GoY controlled areas month-on-month, respectively. Similarly, crisis and emergency livelihood coping strategies were 8 percent and 4 percent higher in SBA and GoY areas, respectively, compared to the month before. Overall, adoption of severe coping strategies was higher in SBA areas than in GoY areas.

	Income not derived from work (charity, humanitarian aid, pension, welfare transfer, remittance, rent)	65%	26%	19%	46%	34%	22%	67%
	No income sources	69%	30%	30%	58%	37%	36%	86%

Methodology:

FAO Yemen conducted the eighth Quarterly monitoring survey with technical support from the DIEM team based in FAO headquarter. In total, sixteen rounds of surveys have been completed so far. This survey aimed to monitor key food insecurity outcomes, and shocks between IPC analysis to support decision-making. Data collection took place from 27 February – 10 March 2024, covering 2,500 households. At least 110 households were surveyed in each of the 22 governorates of Yemen. Data are, therefore, representative of the population of Yemen and at the governorate level. The survey was conducted via computer-assisted telephone interviews (CATI), primarily using Random Digit Dialling (RDD).

Note: The estimated prevalence of food insecurity experienced by the households (FIES) is based on 30-days referenced Food Insecurity Experience Scale (FIES) data and two separate sets of thresholds: 1) “Recent food insecurity (RFI) moderate or severe” is based on the thresholds that is defined in the context of the global SDG monitoring process; 2) “Food insecurity at a severity level that needs immediate attention to protect lives and livelihoods” is based on the severity thresholds suggested in the IPC Manual version 3.1 as indicative of “crisis” level (Phase 3) or worse.”

Annex: Food security outcome indicators, Round 16/QM Round 8, 27 Feb - 10 March 2023

Governorates	FIES Scale, 30-days referenced, using the thresholds in the context of SDG process		FIES Scale, 30-days referenced, using the severity thresholds suggested in the IPC Manual version 3.1 as indicative of "crisis" level (Phase 3) or worse	Food Consumption Group (FCG)			Household Dietary Diversity Score (HDDS)			Household Hunger Scale (HHS)			
	RFI moderate to severe	RFI Severe	Food insecurity at a severity level that needs immediate attention to protect lives and livelihoods	Acceptable	Borderline	Poor	High dietary diversity (5-12 FG)	Medium dietary diversity (3-4 FG)	Low dietary diversity (0-2 FG)	Little to no hunger (HHS score =0)	Slight hunger (HHS Score =1)	Moderate hunger HHS Score 2-3)	Severe hunger (HHS > 4)
