To analyze the impact of the conflict in Syria on food security and livelihoods and to guide strategic planning, the Whole of Syria Food Security Sector, with support from its Technical Working Group and the Regional Food Security Analysis Network (RFSAN) partner agencies, conducted a Food Security and Livelihoods Assessment (FSLA) in Syria in 2017 aimed at understanding the challenges faced by households and communities. This assessment was conducted with partners from Cross Border operational hubs such as Jordan and south Turkey.

The main goals of the assessment were to provide evidence and understanding on the food security and livelihood status of vulnerable households in Syria, identify the main geographic areas and livelihood groups that are vulnerable to food insecurity, and provide evidence for future programming of food security and livelihood projects. The findings from this assessment fed into the Food Security Sector’s Humanitarian Needs Overview for 2018 (http://fscluster.org/syria/document/food-security-situation-syria-expanded).

The FSLA covered 131 accessible subdistricts across 10 governorates, and in total, more than 14,500 household interviews were conducted. Data collection, which was coordinated by the Whole of Syria Food Security Sector, was conducted by 22 partner agencies between March and May 2017.

The indicators and tools used in the assessment were developed in close collaboration with the Technical Working Group and other partners. Other relevant sectors and working groups, including Early Recovery, Agriculture, and Nutrition were also instrumental in providing technical support. To collect contextual information on livelihoods and agricultural production, partners conducted two key informant interviews and two focus group discussions in each subdistrict.

Household-level sampling was conducted using a two-stage cluster sampling approach. A probability proportional to size (PPS) method was used in which communities or clusters were randomly selected within each subdistrict and a target number of interviews were assigned to clusters in proportion to their populations. To overcome logistical constraints associated with subdistricts comprised of many communities, the minimum cluster size was fixed at 5. Approximately 110 interviews were conducted in each subdistrict, corresponding to a minimum 95% confidence level and a 10% margin of error, omitting the design effects of the cluster approach used.

Access constraints led to some variations in the coverage and scope of the assessment. For example, in some areas, an abbreviated version of the data collection tool was used. In locations facing acute security concerns, partners faced difficulties in executing the sampling plan. However, in all locations, partners involved in data collection used a core set of indicators.

Data presented in the factsheets was collected by Food Security Sector partner organizations during March–May 2017 and may not be representative of the food security situation in areas outside of the period in which it was collected. This is specifically more crucial with regard to Ar-Raqqa, Deir ez-Zor and Eastern Ghouta. Thus, new data is needed to establish the food security and livelihoods situation in these areas.
