

Somali: Agriculture Response Dashboard

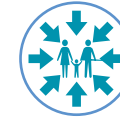

[January - June, 2023]

Four consecutive failed rainy seasons brought on a severe drought in Somali region. The drought is severely affecting the farming and pastoralist population in the area through livestock death, lack of milk, loss of income and crop failure. The situation continued to worsen with the 2022 Deyr and Karan rains failure in the region. The current drought has affected more than half of the livestock population in the region, and an estimated more than 2.1 million livestock have died as a result of drought and livestock disease outbreaks. Less than 40 percent of the total expected harvest of the season will be obtained from riverine areas and some sedentary farming areas of the region, while the yield expected from all the agro-pastoral areas will be nil. In 2023, DRM-ATF targeted 1.09 million people who needed humanitarian assistance. As of June 2023, the DRM-ATF cluster partners reached 184.7 thousand people through various interventions.
